

Objectives:

- **Data Type**
- **Operators**
- **Input and Output**
- **Conversion**

1. Create a simple C# Application. Save file as Lab1.cs
 - a. Open **Start\Programs\Microsoft Visual Studio\ Microsoft Visual Studio.**
 - b. Choose **File\New\Project** to create a new **C# Console application** from **Template** list, click **Console Application.**
 - c. To select **ConsoleApplication1** in the **Name** box, click **ConsoleApplication1.**
 - d. Change name as **Lab1.**
 - e. Type the below code.

```
using System;
using System.Collections.Generic;
using System.Text;

namespace Example
{
    class Example
    {
        static void Main(string[] args)
        {
            Console.WriteLine("hello world");
            Console.ReadLine();
        }
    }
}
```

- f. To save this file, select **File\SaveProgram.cs**

- g. To compile this program select: **Build\Build Program.cs**
 - h. To execute this program select: **Debug\Start Without Debugging**
2. How to use data types and variables
- A. How to use value type:

```
using System;
using System.Collections.Generic;
using System.Text;

namespace Session2
{
    class Example1
    {
        static void Main(string[] args)
        {
            int valueVal = 5;
            Test(valueVal);
            Console.WriteLine("The value of the variable is {0}",
valueVal);
            Console.ReadLine();
        }
        static void Test(int valueVal)
        {
            int temp = 5;
            valueVal = temp * 2;
        }
    }
}
```

The output of the program:

B. How to use Reference Type

```
using System;
using System.Collections.Generic;
using System.Text;

namespace Session2
{
    class ReferenceType
    {
        public int valueVal;
    }
    class Example2
    {
        static void Main(string[] args)
        {
            ReferenceType refer = new ReferenceType();
            refer.valueVal = 5;
            Test(refer);
            Console.WriteLine("The value of the variable is {0}", refer.valueVal);
            Console.ReadLine();
        }
        static void Test(ReferenceType refer)
        {
            int temp = 5;
            refer.valueVal = temp * 2;
        }
    }
}
```

The output of the program:

3. How to use **keyword, comment, constant and literals**

```
using System;
using System.Collections.Generic;
using System.Text;

namespace Session
{
    class Example3
    {
        static void Main(string[] args)
        {
            /*
             * Comment make the program more readable.
             * They help the programmer to explain the purpose of using a
             * particular or method.
             * Comment are ignored by the compiler during the execution
             * of the program.
             * There are three kind of comments such as: Single-line
             * comment, Multi-line comment, XML comment.
             */
            //this is single-line comment
            //assigned constant and literal variable
            const int age = 25;
            //Boolean literal assigned to the variable
        }
    }
}
```

```
bool gender = true; //true is male, false is female
//Integer literal can be assigned to int,uint,long,ulong
datatypes
long IDNumber = 123456;
//Real literal can be assigned to float,double
float mark = 8.5f;
//Character literal can be assigned to a char data type
char blood = 'A';
//String literal can be assigned two types string :regular
and verbatim
//regular:
string name = "Tran The Hai";
//verbatim
string email = "@yahoo.com";
//Null literal has only one value,null:string name=null;
string status = null;
//We can use keyword to named variable
string @string = "FPT-APTECH";

Console.WriteLine("The information detail of a person:");
Console.WriteLine("Fullname:{0}\n",name); //\n is a escape
sequence
Console.WriteLine("Age:{0}\t",age);
Console.WriteLine("Gender:{0}\n",gender);
Console.WriteLine("IDNumber:{0}\n",IDNumber);
Console.WriteLine("Blood Group:{0}\n",blood);
Console.WriteLine("Email:{0}\n",email);
Console.WriteLine("Status:{0}\n\t",status);
Console.WriteLine("Company:{0}",@string);
Console.ReadLine();
}

}

}
```

4. How to use input and output

A. Type this code:

```
/*
*Students.cs
*/
using System;
using System.Collections.Generic;
using System.Text;

namespace School
{
    /* The program creates an Student class to declare,
       initialise and display the variables.Student class stores and
       displays the details of students
       using different data types.
    */
    class Student
    {

        static void Main(string[] args)
        {
            //Declaring and intialising variables to store student details
            int id = 1;
            string name = "David George";
            byte age = 18;
            char gender = 'M';
            float percent = 75.50F;

            //Displaying the student details
            Console.WriteLine("Student ID : {0}", id);
            Console.WriteLine("Student Name : {0}", name);
            Console.WriteLine("Age : " + age);
            Console.WriteLine("Gender : " + gender);
            Console.WriteLine("Percentage : {0:F2}", percent);
        }
    }
}
```

The output of the program:

A screenshot of a Windows command prompt window. The title bar shows 'C:\WINDOWS\system32\cmd.exe'. The window contains the following text:

```
Student ID : 1
Student Name : David George
Age : 18
Gender : M
Percentage : 75.50
Press any key to continue . . .
```

B. Type this below code:

```
using System;
using System.Collections.Generic;
using System.Text;

/* The program demonstrates the input and output operations.*/

class Student
{
    static void Main(string[] args)
    {
        //Declaring integer constant to store value 100
        const int percentConst = 100;

        //Declaring variable to store the student name
        string studentName;

        //Declaring variables to store the student marks
        int english, maths, science;

        //Declaring and initialising variable to store the percentage
        float percent = 0.0F;

        //Accepting the details of the student
        Console.Write("Enter name of the student : ");
```

```
        studentName = Console.ReadLine();

        Console.Write("Enter marks for english : ");
        english = Convert.ToInt32(Console.ReadLine());

        Console.Write("Enter marks for maths : ");
        maths = Convert.ToInt32(Console.ReadLine());

        Console.Write("Enter marks for science : ");
        science = Convert.ToInt32(Console.ReadLine());

        //Calculating the percentage of the student
        percent = ((english + maths + science) * percentConst) / 300;

        //Displaying the details of the student
        Console.WriteLine("Student Name : " + studentName);

        Console.WriteLine("Marks obtained in English : {0}",
english);

        Console.WriteLine("Marks obtained in Maths : {0}",
maths);

        Console.WriteLine("Marks obtained in Science : {0}",
science);

        Console.WriteLine("Percent : {0:F2}", percent);
    }
}
```

```
C:\WINDOWS\system32\cmd.exe
Enter name of the student : Pham Tung Chi
Enter marks for english : 100
Enter marks for maths : 100
Enter marks for science : 90
Student Name : Pham Tung Chi
Marks obtained in English : 100
Marks obtained in Maths : 100
Marks obtained in Science : 90
Percent : 96.00
Press any key to continue . . . _
```

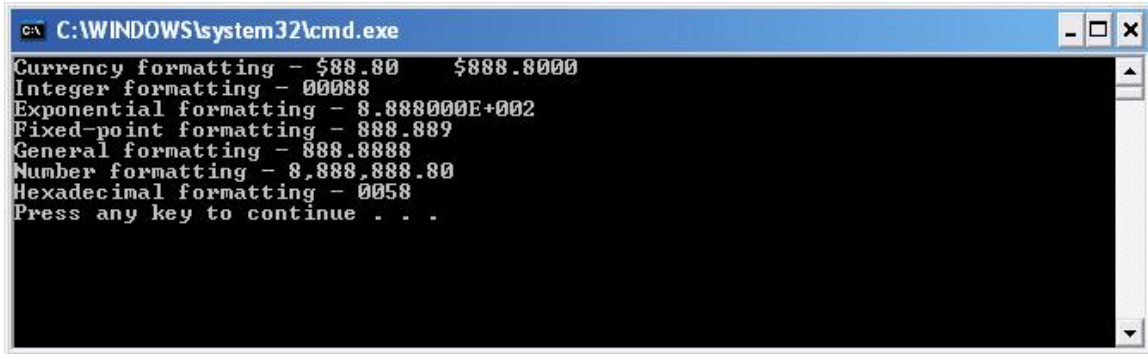

5. Numeric formatting

```
/*
 * NumFormat.cs
 */

using System;
using System.Collections.Generic;
using System.Text;

class NumberFormat
{
    static void Main(string[] args)
    {
        Console.WriteLine("Currency formatting - {0:C}          {1:C4}",
88.8, 888.8);

        Console.WriteLine("Integer formatting - {0:D5}", 88);
        Console.WriteLine("Exponential formatting - {0:E}", 888.8);
        Console.WriteLine("Fixed-point formatting - {0:F3}", 888.8888);
        Console.WriteLine("General formatting - {0:G}", 888.8888);
        Console.WriteLine("Number formatting - {0:N}", 8888888.8);
        Console.WriteLine("Hexadecimal formatting - {0:X4}", 88);
    }
} // End of class
```

```
C:\WINDOWS\system32\cmd.exe
Currency formatting - $88.80      $888.8000
Integer formatting - 00088
Exponential formatting - 8.888000E+002
Fixed-point formatting - 888.889
General formatting - 888.8888
Number formatting - 8,888,888.80
Hexadecimal formatting - 0058
Press any key to continue . . .
```

6. Datetime formatting

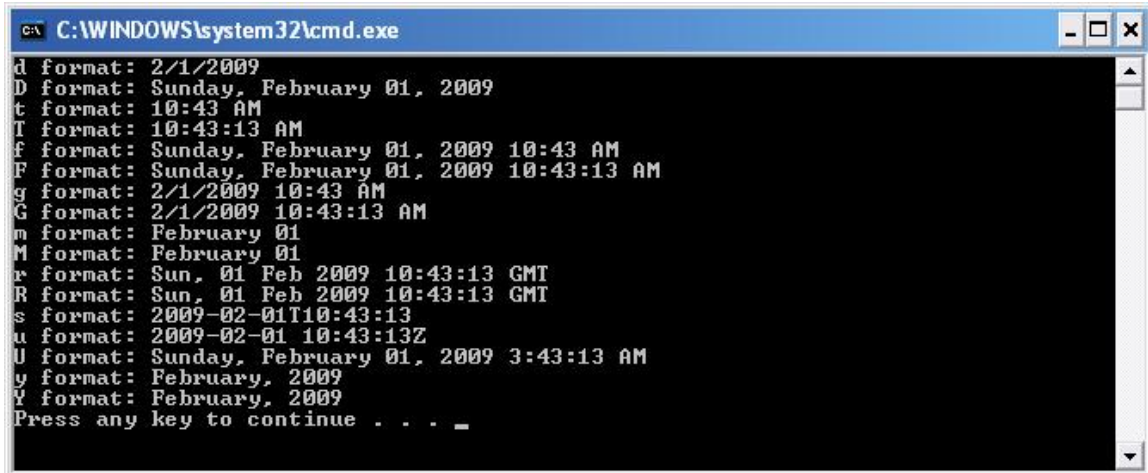

a. Example 1

```
using System;

class MainClass
{
    public static void Main()
    {
        DateTime dt = DateTime.Now;

        Console.WriteLine("Time is {0:hh:mm tt}", dt);
        Console.WriteLine("24 hour time is {0:HH:mm}", dt);
        Console.WriteLine("Date is {0:ddd MMM dd, yyyy}", dt);
        Console.WriteLine("Time with seconds: " + "{0:HH:mm:ss tt}",
dt);

        Console.WriteLine("Use m for day of month: {0:m}", dt);
        Console.WriteLine("use m for minutes: {0:%m}", dt);
    }
}
```

```
C:\WINDOWS\system32\cmd.exe
d format: 2/1/2009
D format: Sunday, February 01, 2009
t format: 10:43 AM
T format: 10:43:13 AM
f format: Sunday, February 01, 2009 10:43 AM
F format: Sunday, February 01, 2009 10:43:13 AM
g format: 2/1/2009 10:43 AM
G format: 2/1/2009 10:43:13 AM
m format: February 01
M format: February 01
r format: Sun, 01 Feb 2009 10:43:13 GMT
R format: Sun, 01 Feb 2009 10:43:13 GMT
s format: 2009-02-01T10:43:13
u format: 2009-02-01 10:43:13Z
U format: Sunday, February 01, 2009 3:43:13 AM
y format: February, 2009
Y format: February, 2009
Press any key to continue . . . _
```

b. Example 2

```
using System;
class MainClass
{
    public static void Main()
    {
        DateTime dt = DateTime.Now; // obtain current time

        Console.WriteLine("d format: {0:d}", dt);
        Console.WriteLine("D format: {0:D}", dt);

        Console.WriteLine("t format: {0:t}", dt);
        Console.WriteLine("T format: {0:T}", dt);

        Console.WriteLine("f format: {0:f}", dt);
        Console.WriteLine("F format: {0:F}", dt);

        Console.WriteLine("g format: {0:g}", dt);
        Console.WriteLine("G format: {0:G}", dt);

        Console.WriteLine("m format: {0:m}", dt);
        Console.WriteLine("M format: {0:M}", dt);

        Console.WriteLine("r format: {0:r}", dt);
        Console.WriteLine("R format: {0:R}", dt);
    }
}
```

```
        Console.WriteLine("s format: {0:s}", dt);

        Console.WriteLine("u format: {0:u}", dt);
        Console.WriteLine("U format: {0:U}", dt);

        Console.WriteLine("y format: {0:y}", dt);
        Console.WriteLine("Y format: {0:Y}", dt);
    }
}
```

C:\WINDOWS\system32\cmd.exe

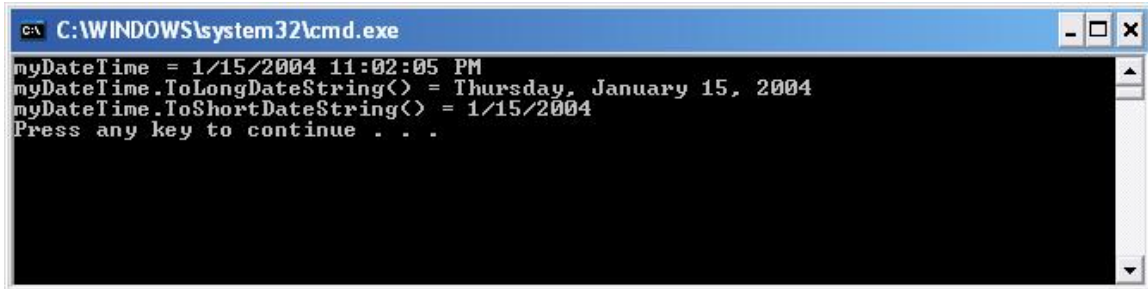

```
d format: 2/1/2009
D format: Sunday, February 01, 2009
t format: 10:42 AM
T format: 10:42:43 AM
f format: Sunday, February 01, 2009 10:42 AM
F format: Sunday, February 01, 2009 10:42:43 AM
g format: 2/1/2009 10:42 AM
G format: 2/1/2009 10:42:43 AM
m format: February 01
M format: February 01
r format: Sun, 01 Feb 2009 10:42:43 GMT
R format: Sun, 01 Feb 2009 10:42:43 GMT
s format: 2009-02-01T10:42:43
u format: 2009-02-01 10:42:43Z
U format: Sunday, February 01, 2009 3:42:43 AM
y format: February, 2009
Y format: February, 2009
Press any key to continue . . .
```

c. Example 3

```
using System;

class MainClass
{
    public static void Main()
    {
        DateTime myDateTime = new DateTime(2004, 1, 15, 23, 2, 5);
        Console.WriteLine("myDateTime = " + myDateTime);
        Console.WriteLine("myDateTime.ToString() = " +
myDateTime.ToString());
        Console.WriteLine("myDateTime.ToShortDateString() = " +
myDateTime.ToShortDateString());
    }
}
```

```
}  
}
```

```
C:\WINDOWS\system32\cmd.exe  
myDateTime = 1/15/2004 11:02:05 PM  
myDateTime.ToLongDateString() = Thursday, January 15, 2004  
myDateTime.ToShortDateString() = 1/15/2004  
Press any key to continue . . .
```

7. Conversion

a. Type below snippet code:

```
using System;  
using System.Collections.Generic;  
using System.Text;  
  
namespace Lab_guide  
{  
    class ConvertDemol  
    {  
        static void Main(string[] args)  
        {  
            short myShort = 1700;  
            System.Console.WriteLine("myShort = " + myShort);  
  
            int myInt = myShort;  
            System.Console.WriteLine("myInt = " + myInt);  
  
            myShort = (short)(myInt * 2);  
            System.Console.WriteLine("myShort = " + myShort);  
            Console.ReadLine();  
        }  
    }  
}
```

```
}
```

The output of the program:

b. This snippet code below explains how to clearly implicit and explicit convert datatype.

```
using System;
using System.Collections.Generic;
using System.Text;

namespace Lab_guide
{
    class ConvertDemo2
    {
        static void Main(string[] args)
        {
            // all implicit
            sbyte v = 55;
            short v2 = v;
            int v3 = v2;
            long v4 = v3;

            // explicit to "smaller" types
            v3 = (int) v4;
            v2 = (short) v3;
            v = (sbyte) v2;
            Console.WriteLine("v="+v);
            Console.WriteLine("v2="+v2);
            Console.WriteLine("v3="+v3);
            Console.WriteLine("v4="+v4);
        }
    }
}
```

```
        Console.ReadLine();  
    }  
}  
}
```

c. This below code that boxing occurs when passing values. Type it now.

```
using System;  
using System.Collections.Generic;  
using System.Text;  
  
namespace Lab_guide  
{  
    class ConvertDemo4  
    {  
        static void Main(string[] args)  
        {  
            int x;  
            x = 10;  
  
            Console.WriteLine("Here is x: " + x);  
  
            // x is automatically boxed when passed to sqr()  
            x = ConvertDemo4.boxObject(x);  
            Console.WriteLine("Here is x squared: " + x);  
            Console.ReadLine();  
        }  
        static int boxObject(object o)  
        {  
            return (int)o * (int)o;  
        }  
    }  
}
```

The output of the program:

d. This below code that explicit and implicit boxing of an integer. Type it now.

```
using System;
using System.Collections.Generic;
using System.Text;

namespace Lab_guide
{
    class ConvertDemo5
    {
        static void Main(string[] args)
        {
            // implicit boxing of an int
            int myInt1 = 10;
            Console.WriteLine("myInt1.ToString() =" +
myInt1.ToString());
            Console.WriteLine("myInt1.GetType() = " +
myInt1.GetType());

            // explicit boxing of an int to an object
            int myInt2 = 10;
            object myObject = myInt2; // myInt2 is boxed
            Console.WriteLine("myInt2 = " + myInt2);
            Console.WriteLine("myObject = " + myObject);

            // explicit unboxing of an object to an int
            int myInt3 = (int)myObject; // myObject is unboxed
            Console.WriteLine("myInt3 = " + myInt3);
        }
    }
}
```

```
        Console.ReadLine();  
  
    }  
  
}
```

The output of the program:

```
C:\ file:///D:/Source Code/Lab_guide/Lab_guide...  
myInt1.ToString() =10  
myInt1.GetType() = System.Int32  
myInt2 = 10  
myObject = 10  
myInt3 = 10
```

Do It Yourself

- 1.1. Write a program to enter: name, address, phone and display these information.
- 1.2. Write a program to calculate average of subjects include: math, physical, chemical, foreign language, history.
- 1.3. Do Workshop 1, 2 in CD.
- 1.4. Do ACTCSharp_Module1_Assignment.pdf in CD.
- 1.5. Do ACTCSharp_Module2_Assignment.pdf in CD.
